Def of ODE & ODEs: $\frac{dy}{dt} = f(t,y)$ & ODEs: $\frac{dy}{dt} = \mathbf{f}(t,y)$, $\mathbf{y} = (y_1,...,y_d)^T$, $\mathbf{f}(t,y) = (f_1(t,y),...,f_d(t,y))^T$ **Autonomous**: $\frac{dy}{dt} = \mathbf{f}(\mathbf{y}) \Rightarrow \text{ autonomous ODE}(\mathbf{s})$. $|| \Downarrow \text{ New Autonomous ODEs}: \frac{dy}{ds} = \mathbf{f}(y_{d+1},y) \text{ and } \frac{dy_{d+1}}{ds} = 1$ • **Change to Autonomous**: For $\frac{dy}{dt} = \mathbf{f}(t,y)$. Let $y_{d+1} = t$ and *new* independent variable s s.t. $\frac{dt}{ds} = 1$

Linearity: ODE: $\frac{dy}{dt} = f(t, y)$ is linearity if f(t, y) = a(t)y + b(t) || ODEs: If each ODE is linear, then the ODEs are linear.

Picard's Theorem: If f(t, y) is continuous in $D := \{(t, y) : t_0 \le t \le T, |y - y_0| < K\}$ and $\exists L > 0$ (Lipschitz constant) s.t.

 $\forall (t,u), (t,v) \in D \quad |f(t,u)-f(t,v)| \leq L|u-v| \text{ (ps:Can use MVT)}. \text{ And Assume that } M_f(T-t_0) \leq K, M_f := \max\{|f(t,u)|: (t,u) \in D\}$ \Rightarrow **Then**, \exists a unique continuously differentiable solution y(t) to the IVP $\frac{dy}{dt} = f(t,y), y(t_0) = y_0$ on $t \in [t_0,T]$.

Existence & Uniqueness Theorem: IVP $\frac{d\mathbf{y}}{dt} = \mathbf{f}(t, \mathbf{y}), \mathbf{y}(t_0) = \mathbf{y}_0$. If f(t, y) and $\frac{\partial f}{\partial y_i}$ are continuous in a neighborhood of (t_0, \mathbf{y}_0) . ⇒ **Then**, $\exists I := (t_0 - \delta, t_0 + \delta)$ s.t. \exists a unique continuously differentiable solution $\mathbf{y}(t)$ to the IVP on $t \in I$.

Acknowledge

Notation	Meaning	Notation	Meaning
[<i>a</i> , <i>b</i>]	Approximate function for $t \in [a, b]$	$t_0 = a \mid t_N = b$	Assume that $t_0 = a$, $t_N = b$
N	number of timesteps (i.e. Break up interval [a, b] into N equal-length sub-intervals)	h	stepsize $(h = \frac{b-a}{N})$
t_i	Define $N + 1$ points: $t_0, t_1,, t_N$	t_m	$t_m = a + h \cdot m = t_0 + h \cdot m$
y_i	Approximation of y at point $t = t_i$ (Except y_0)	$y(t_i)$	Exact value of y at point $t = t_i$

Euler's Method and Taylor Series Method

Euler's Method Algorithm: Approximate ODE $\frac{dy}{dt} = f(t, y), y(t_0) = y_0$ with number of steps N. (Similarly for ODEs)

 $\Rightarrow \mathbf{for} \ n = 0, 1, 2, ..., N-1: \quad y_{n+1} = y_n + hf(t_0 + nh, y_n) = y_n + hf(t_n, y_n) \quad \mathbf{end}$ $\mathbf{Boundedness \ Theorem}: \ \text{For} \ \frac{dy}{dt} = f(t, y), y(a) = y_0 \ \text{and suppose there exists a unique, twice differentiable, solution } y(t) \ \text{on } [a, b].$ Suppose: y is continuous and $\left|\frac{\partial f}{\partial y}\right| \le L$. \Rightarrow the solution y_n given Euler's method satisfies: $e_n = |y_n - y(t_n)| \le Dh$, $D = e^{(b-a)L} \frac{M}{2L}$

• **Lemma**: If $v_{n+1} \le Av_n + B$, then $v_n \le A^n v_0 + \frac{A^n - 1}{A - 1}B$ If $v_n = e_n := y_n - y(t_n)$, then A = 1 + hL, $B = h^2 M/2$ (suppose |y''| < M) **Order Notation (** \mathcal{O} **)**: we write $z = \mathcal{O}(h^p)$ if $\exists \mathcal{C}, h_0 > 0$ s.t. $|z| \le Ch^p$, $0 < h < h_0$

Flow Map (Φ **)**: $\Phi_h(y)$ is a flow function if: $\Phi_{t_0,h}(y) = y(t_0 + h; t_0, y_0)$ Approx: $\Psi_h(y) := \widehat{\Phi}_h(y)$ where $\Psi(y_n) = y_{n+1}$

Taylor Series Method: Approximate ODE $\frac{dy}{dt} = f(t,y), y(t_0) = y_0$ with *n-order Methods*: 用 Taylor Series 在 $t_0 + h$ 处展开保留到 n 阶 \cdot ps: Taylor Series: $y(t_0 + h) = y(t_0) + hy'(t_0) + \frac{h^2}{2}y''(t_0) + \dots + \frac{h^{n-1}}{(n-1)!}y^{(n-1)}(t_0) + \frac{h^n}{n!}y^{(n)}(t^*), t^* \in [t, t+h]$ $y' = f, y'' = f_t + f_y f$

Convergence of One-Step Methods consider for autonomous y' = f(y)

Global Error: global error after n steps: $e_n := y_n - y(t_n)$ **Local Error**: For *one-step* method is: $le(y,h) = \Psi_h(y) - \Phi_h(y)$

Consistent: If $||le(y,h)|| < Ch^{p+1}(< \mathcal{O}(h^{p+1}))$, C > 0. \Rightarrow Consistent at order p. **Stable**: If $||\Psi_h(u) - \Psi_h(v)|| \le (1 + h\hat{L})||u - v||$

Convergent: A method is convergent if: $\forall T$, $\lim_{h \to 0, \ h = T/N} \max_{n = 0, 1, \dots, N} ||e_n|| = 0$ \downarrow Then the global error satisfies: $\max_{n = 0, 1, \dots, N} ||e_n|| = \mathcal{O}(h^p)$ p-th order **Convergence of One-Step Method**: For y' = f(y), and a one-step method $\Psi_h(y)$ is 1 consistent at order p and 2 stable with \hat{L} \uparrow . (ps: $C = \frac{C}{\hat{L}}(e^{T\hat{L}} - 1)$) **Polynomial Interpolation:**
